Looking for information about individual medical schools?

When you’re ready to start exploring medical schools, subscribe to **Medical School Admission Requirements (MSAR)**, a website with comprehensive profiles of each U.S. and Canadian medical school.

**Medical School Admission Requirements** is a trusted source of information about medical schools, updated with data from the MCAT® exam, the AMCAS® application, and medical school admissions offices. A subscription enables you to browse, search, sort, and compare individual U.S. and Canadian medical schools. Profiles are updated throughout the year by medical school staff to help ensure that information is both complete and current.

Considered the “gold standard,” **Medical School Admission Requirements** provides information not found anywhere else.

For more information, visit aamc.org/msar.
Association of American Medical Colleges

The Association of American Medical Colleges serves and leads the academic medicine community to improve the health of all.

Founded in 1876 and based in Washington, D.C., the AAMC is a not-for-profit association dedicated to transforming health care through innovative medical education, cutting-edge patient care, and groundbreaking medical research. Our members include all 147 accredited U.S. and 17 accredited Canadian medical schools; nearly 400 major teaching hospitals and health systems, including 51 Department of Veterans Affairs medical centers; and more than 80 academic societies. Through these institutions and organizations, we serve the leaders of America’s medical schools and teaching hospitals and their 160,000 faculty members, 83,000 medical students, and 115,000 resident physicians.

The AAMC’s many programs and services strengthen the world’s most advanced medical care by supporting the entire spectrum of education, research, and patient care activities conducted by our member institutions. The AAMC and our members are dedicated to the communities we serve and are steadfast in our desire to earn and keep the public’s trust for the role we play in improving the nation’s health.

The AAMC develops and administers the Medical College Admission Test® (MCAT®), operates the American Medical College Application Service® (AMCAS®), and provides detailed admission information to medical schools and undergraduate premedical advisors.

Important Notice

The information in this book is based on the most recent data provided by member medical schools at the request of the Association of American Medical Colleges (AAMC).

We edited and, in some instances, condensed the material to meet space limitations. In compiling this edition, we made every reasonable effort to ensure the accuracy and timeliness of the information, and, except where noted, the information was updated as of February 2017. All the information, however, especially figures on tuition and expenses, is subject to change and is nonbinding for the medical schools listed and the AAMC. All medical schools listed in this edition, as with other educational institutions, are subject to federal and state laws prohibiting discrimination on the basis of race, color, religion, sex, age, disability, or national origin. Such laws include Title VI of the Civil Rights Act of 1964, Title IX of the Education Amendments of 1972, Section 504 of the Rehabilitation Act of 1973, the Americans with Disabilities Act, and the Age Discrimination Act of 1975, as amended. For the most current and complete information about costs, official policies, procedures, and other matters, please contact individual schools.

In applying to U.S. or Canadian medical schools, applicants need not go through any commercial agencies. The AAMC does not endorse any organization or entity that purports to help applicants gain admission to medical school, other than undergraduate premedical advisors and medical school admission officers.

AAMC Commitment to Diversity and Inclusion

The AAMC’s mission is to serve and lead the academic medicine community to improve the health of all. As the U.S. population ages and grows more diverse and disparities in health care persist, understanding the benefits of diversity and inclusion becomes critical to addressing the health of the nation. The AAMC’s commitment to diversity and inclusion in medicine and biomedical research spans more than three decades, demonstrated by ongoing leadership and engagement in activities—starting as early as high school—that promote diversity and inclusion through programs, advocacy, and research. Information about AAMC initiatives is available at aamc.org/diversity.

How to Use This Guide

The AAMC works through many avenues to support medical education and help aspiring physicians succeed in their path to medical school. We created this guide to serve as a resource for students who are considering a career as a physician. Each chapter explains one aspect of the medical school admission process, and each is carefully reviewed every year by content experts at the AAMC.

Some of you may choose to read this book cover to cover, while others may prefer to skip ahead to chapters that are most relevant to where you are in the application process. Here are some tips to get the most out of the guide.

**Skim the table of contents before you begin reading.**
Not everyone takes the same path or is in the same place when they use this guide. You may want to read the chapters in the order that most relates to where you are now and what you need to know to move forward.

**Use and update the chapter worksheets.**
At the end of each chapter, you’ll find a worksheet that can help you with your medical school application. Topics include keeping track of your volunteer experiences, finding individuals to write your letters of evaluation, and determining the right time to take the MCAT exam. You may want to complete some of these worksheets after you read the chapter, or you may want to hold onto them until you’re at that phase of the application process. You can make copies or complete them using a fillable PDF form at aamc.org/msar-resources.

We encourage you to share your work with your pre-health advisor as you fill the worksheets out. You should have an advisor or a mentor to help guide you through this process. Find out more about the benefits of working with an advisor in Chapter 2, “Academic Preparation.” If you do not have a pre-health advisor at your school, you can find one at NAAHP.org.

**Look through the data in this book to understand the national picture.**
Part of what will make you a well-prepared applicant will be knowing more about the national applicant and acceptance data. While every applicant is different, and while every medical school accepts applicants with a range of scores and experiences, it can be helpful to see how you compare with other applicants across the country. This will help you to decide, along with your pre-health advisor, when you’re ready to apply to medical school. The data in this book come directly from the AAMC Data Warehouse, the AAMC Data Book, the American Medical College Application Service (AMCAS), the Medical College Admission Test (MCAT), and surveys conducted with entering and graduating medical students such as the Graduation Questionnaire (GQ) and the Matriculating Student Questionnaire (MSQ). The data are comprehensively updated each year with the most current information available at the time of printing. Because it comes directly from the source, you can trust that it is the most up-to-date and accurate information available. For more and current information, you can check the AAMC Facts Tables available at aamc.org/facts.

**Check out the Medical School Admission Requirements site when you’re ready to look at schools individually.**
One of the most important decisions you’ll make is where to apply to medical school. The AAMC’s Medical School Admission Requirements website provides the most comprehensive, up-to-date information and data. When you’re ready to start researching medical schools, tap into this powerful online database of information on U.S. and Canadian medical schools and baccalaureate-MD programs at aamc.org/msar. As the gold standard for admission requirement information, this is the only comprehensive resource of accurate and current data that comes directly from the MCAT program, the AMCAS program, and medical school admission offices. Your one-year subscription allows you to search, sort, and save information.
The AAMC has resources to help you, from inspiration through practice.
We’ve got numerous resources to help you whether you’re just beginning to consider a career as a physician or you’re in the middle of applying to medical school. Take a look at these pre-med and applicant resources and tell other applicants about them if you find them useful.

A note about “MD versus DO” programs: This guidebook explains the process of preparing for and applying to medical doctor (MD) programs accredited by the Liaison Committee on Medical Education (LCME). You may have heard of osteopathic medicine programs that grant doctor of osteopathic medicine (DO) degrees. DO and MD programs have many similarities; both types of physicians are fully certified to practice medicine in the United States after passing board examinations. For more information about DO-granting schools and admission requirements, see the American Association of Colleges of Osteopathic Medicine site (aacom.org).
First, I want to congratulate you on your decision to explore medical school and a career in medicine. This is the first step into a remarkable and wonderful field.

When I decided medicine was my path, I talked to my mother, who is a nurse. She shared how challenging life as a doctor is: the difficult training, the long hours, the high expectations. She emphasized that being a doctor is not as glamorous as television makes it seem. I am grateful for her insight because it forced me to evaluate the reasons behind my decision. I looked at my shadowing and volunteering experiences differently and discovered a love of medicine and patient care that drove me to work even harder to achieve my goal of becoming a doctor. These experiences helped me to realize there is nothing else that I could imagine myself doing even with the tremendous effort required and the consistent difficulties along the path.

Now in my third year of medical school, I can say this love of interacting with patients and using my passion for science and medicine to improve lives is what has kept me going through the challenges. It is what gets me through a long day in the hospital or the stress of studying for an exam, and it is the same motivation that energized me when I was in your position applying to medical school.

I encourage you to dig deep and find your core motivation. Let this motivation guide your application, and it will be what carries you through the challenges ahead. This guidebook will help you through the nitty-gritty of the application process, but never lose sight of the reason why being a doctor is what you are meant to do.

Tomorrow’s Doctors, Tomorrow’s Cures®

The dream of becoming a doctor is something that many applicants seem to know from an early age. In fact, a recent AAMC survey shows that half of all medical students who responded to the survey had chosen a medical career before they set foot in college—and one in five had made the choice before they even started high school (see Figure 1.1).
Whether you have always known that you wanted to be a doctor or are just starting to consider the idea, being a physician is an extremely rewarding profession. A career in medicine offers numerous opportunities to make a real difference in the lives of countless people.

As a doctor, you are likely to see new life come into the world or provide comfort to those about to leave it. Or you may choose to help build the future of medicine by educating the next generation of physicians. Perhaps you will dedicate yourself to discovering new cures for devastating diseases.

Whichever direction you follow, you will—either directly or indirectly—reduce or eliminate people’s pain and suffering, improve their quality of life, and provide invaluable service to your local community or the country as a whole.

**Your Medical Career Driven by Your Interests**

Another benefit of the field is that you can choose from many and varied ways to practice. From clinical practice to biomedical research, from public health to medical education—the choices are plentiful (see Figure 1.2). Medical students typically have clear preferences for the areas they plan to specialize in after graduation. Many students change or further refine their specialty preferences as they gain experience and knowledge in medical school. If your interests change with time and experience, medicine—because of its emphasis on lifelong learning and ties to research and technological developments—will provide you with opportunities to refine your skills and reorient your practice. Here are some examples of possible career options:

- The satisfaction of long-term patient relationships is one attraction of family medicine and internal medicine, where the bulk of time is spent in direct contact with patients. Physicians who work under the umbrella of “primary care” often care for entire families and enjoy the challenges that come from treating a diverse population with varied backgrounds and conditions.

- Other physicians may prefer to pursue detailed knowledge about the intricacies of a single organ or system, such as that required of cardiologists, ophthalmologists, dermatologists, endocrinologists, and other specialists.

*Figure 1.1. When did you decide to study medicine? Most applicants knew early on that they wanted to be a doctor.*

- 31.6% before high school
- 22.7% during high school or before college
- 10.3% during first two years of college
- 9.2% during junior year of college
- 20.5% during senior year of college
- 3.7% after receiving bachelor’s degree
- 1.9% after receiving advanced degree

*Source: AAMC’s 2016 Matriculating Student Questionnaire (MSQ).*
• Interested in **scientific exploration** and the desire to **break new ground in medical knowledge**? Physicians with these interests are found in the nation’s private and public laboratories and research institutions.

• Those with a commitment to social justice and an interest in fulfilling the health care needs of the underserved and disadvantaged can meet those challenges in **urban and rural clinics, in public health, or as medical missionaries**.

• Careers in **general surgery** often suit people who have a desire to see immediate results of their interventions. **Plastic and reconstructive surgery** draws others with artistic skills and aesthetic interests.

• Those interested in mind-body interactions and the emotional lives of their patients might find a home in **neurology or psychiatry**.

• The fast pace of medicine draws some to work as **emergency physicians or trauma surgeons**.

• Others motivated by the interest of national defense may use their skills as **flight surgeons or in military medicine**.

• The **economic and public policy aspects of health care** guide some physicians to think tanks and health-related organizations, as well as to serve in the legislative and executive branches of government.

• For those fascinated by the issues facing groups of patients with age-defined illnesses and problems—from the risks in infancy and early childhood to the challenges of older life—fulfillment can come in careers as **pediatricians and geriatricians**.

• Assisting patients in overcoming complex fertility and gestational problems is the hallmark of the specialists in **reproductive endocrinology and obstetrics and gynecology**.

• Those dedicated to reducing the incidence of birth defects and inherited diseases might find their calling in **medical genetics**.

• The detection, prevention, and eradication of injury and disease draw people to the fields of **preventive medicine and epidemiology**.

---

**Figure 1.2. What specialties were entering medical students considering in 2016?**

![Chart showing the percentage of medical students considering various specialties in 2016.](chart.png)

**Source:** AAMC’s 2016 Matriculating Student Questionnaire (MSQ).
Once you enter medical school, you’ll start actively learning about these and the myriad other career options and considering where you best fit. This is addressed further in Chapter 3, in the section “Determining How You Want to Practice Medicine.”

What About the Future?

As long as we’re looking ahead, let’s look way ahead. In 5, 10, 15 years, what will medicine look like?

One thing is certain—the face of medicine changes continually. A good example of this has to do with the prevalence of women in medicine. In the 1976–1977 academic year, women made up just 24.7 percent of all medical school matriculants. Compare that with 2015–2016, when they made up almost half—49.8 percent—of the entering class, according to the AAMC Data Book.

Look back one generation, and you can see that many new fields have emerged.

- An excellent example dates back to the early 1980s. Back then, a new—and fatal—illness was taking hold that nobody could identify. We now know it well: AIDS. Infectious disease is currently a large medical subspecialty, and, as a result, significant advances have been made in extending the lives of those infected with HIV.

- Other advances are more recent. Minimally invasive surgery, in which surgeons carry out precise procedures sometimes with the assistance of a robot, is becoming increasingly popular. Such surgeries are currently available and used in procedures on lungs, the esophagus, the prostate, the uterus, and kidneys. Through surgeries like these, patients are likely to benefit from smaller incisions, lower risk of complications, shorter hospital stays, less pain, and speedier recoveries.

- A career path unavailable to the previous generation, personalized medicine, is a field where the technology allows physicians to identify mutated genes and alert patients about their predisposition to a specific disease. (The next step—actually treating diseases with genes—is on the horizon.)

- Then, there are the more established fields that have evolved to take on new applications. Radiology, for example, is no longer about just reading X-rays. Radiologists can now perform surgery as part of interventional radiology.

Even more exciting is what lies ahead: gene therapy, portable medical records, distance surgery, and focused medication. The possibilities for advancement in medical research are limitless.

- Early tests of gene therapy have been especially favorable for cystic fibrosis, in which the correct CFTR gene is transported via a harmless virus or liposome.

- Similarly, research is under way in the field of pharmacogenomics, in which patients’ treatments are tailored according to their specific genetic code. For example, if a patient’s genes fit a certain type of cancer code, the physician will prescribe the “matching” pharmaceutical that has been developed to destroy cells with that code—and will know, rather than hope, that the treatment is likely to work. Still in its infancy, most forms of tailored drugs are used in oncology, but studies are progressing in areas of cardiology, diabetes, psychiatric disorders, and more.

- Also in development is focused preventive care, which uses genetic diagnosis to identify to a very specific degree how likely a patient is to develop a certain disease or condition—and then prevents that development before it has a chance to begin.
Other advances will be administrative in nature; the days of hunting down medical records may come to an end, for example. One possibility being explored is a portable medical records system, or a national online database of individual health records. Everyone will carry a smart card (or have a microchip inserted under his or her skin!), allowing physicians to access medical records. The benefit? Errors are reduced, files can no longer be lost, delays are minimized, and the experience of having repeated—that is, unnecessary—tests is eliminated.

**Workforce Issues**

Above all, know this: Whatever specialty you choose, your services as a physician will be needed.

According to a study commissioned by the AAMC, there will be a shortage of 61,700 to 94,700 physicians by 2025. The shortage is being driven in large part by the rapid expansion of the number of Americans age 65 or over. Our doctors are getting older, too. Nearly one-third of today’s physicians will be of retirement age in the next decade, just as more Americans need care. A continued demand for physicians and other medical professionals is projected.

Figure 1.3 illustrates the growing physician shortages between 2014 and 2025. Still, the shortages will be experienced unevenly, and some geographic areas will feel the effect more strongly than others. With that in mind, you might consider the trends as you think about the direction you’d like your career to take.

**Primary Care**

Although the nation is facing an overall shortage of physicians, many people are particularly concerned about the growing deficit of primary care doctors. Within the overall shortage of physicians, experts expect a shortfall of between 14,900 and 35,600 primary care physicians by 2025. To encourage U.S. medical school graduates to pursue a career in primary care, the federal government and many state governments offer a variety of scholarship and loan repayment programs. You may want to explore the rewards this type of career offers, including the satisfaction that comes from delivering comprehensive care and having long-term relationships with your patients.

**Underserved Areas**

The impact of this shortage is expected to be greatest in underserved areas—the urban and rural areas where health care is already scarce. If you choose to serve in a community designated as a Health Professional Shortage Area by the U.S. Department of Health and Human Services, you may be able to take advantage of a federal program—the National Health Service Corps—that offers scholarships and loan repayment.

According to the AAMC’s 2016 Matriculating Student Questionnaire, about 27 percent of entering students planned to work in a primarily underserved area, and more than half of all entering students hadn’t yet decided where they wanted to work. (Learn more about this program in Chapter 10, “You Can Afford Medical School.”)
A More Collaborative Approach

As Congress explores various scenarios as it moves forward with instituting health care reform, one thing is nearly certain: Given the projected shortage of physicians, we will need to develop new models of health care delivery that make better, more efficient use of all health care professionals—not just doctors. That means you can expect to work within a more collaborative, “shared” environment, in which a team of health care providers—physician’s assistants and nurse practitioners, for example—work more in tandem. Exactly how that will play out is still in development, but the goal is to create a more efficient system, increase patient satisfaction, and, ultimately, improve health outcomes.

A collaborative approach to health care delivery is instilled beginning in the early years of medical education. Read more about the use of small-group discussions, problem-based learning, and other educational models in Chapter 3, “Your Medical School Years: The Education Process.”

Immediate Steps That Lie Ahead

That’s the future—or at least what we expect. Right now, though, you’re undoubtedly more focused on the short-term goal of getting into medical school.

So what is the process for applying to medical school? What lies ahead?

Let’s be candid. Getting into medical school isn’t easy. (But it’s definitely doable—as the more than 88,304 students currently enrolled can testify!) You will need to prepare for and take the MCAT® exam, select schools to apply to, complete the application process, write a personal statement, gather letters of evaluation, secure your undergraduate transcripts, and interview. And then you will wait for notices of acceptance and make your final decision. If you’re not accepted, you’ll need to evaluate your options and figure out what to do next. All of this will be covered in the following chapters.

But first, right now, you can take many steps to make yourself a more attractive candidate to admission committees. From taking the necessary courses to working effectively with your pre-health advisor to participating in extracurricular and volunteer activities that demonstrate your true interest in medicine, there’s a lot you can do.

In the next chapter, we focus on your undergraduate preparation.

A Note for Career Changers or Gap-Year Applicants

If a year or more has passed since you graduated from college, you’re not alone. Well over half (60.6 percent) of matriculating medical students indicated in the AAMC’s Matriculating Student Questionnaire that there was a gap between their college graduation and matriculation to medical school of at least a year. Medical schools do not see a break between the end of college and beginning of medical school as a weakness or negative attribute. In fact, what you’ve experienced or accomplished during this time may enhance your application and qualifications significantly.

We’ll add tips and things to consider throughout this book to help guide you through the application and preparation process. We know there may be some variation in how you’ll need to prepare yourself and compile the different components of your application now that you’re no longer on campus.
When applying to medical school, it’s difficult not to transform yourself into a number—well, two numbers: your MCAT® score and GPA. While these figures impact your application success, they are only two facets.

I often found myself riddled with self-doubt during that difficult ‘glide year.’ Was my MCAT score high enough? Would admissions committees overlook that low grade? I had to remember that I was more than a mathematical index on a percentile chart. I was an enthusiastic applicant and a lover of people, and I had plenty of clinical experiences and medical exposure to prove it.

Applying to medical school is a constant assault on your self-esteem as you strive to meet the high standards you set for yourself. Be realistic, but don’t be ruthless. Know your weaknesses, but celebrate your strengths. The skills you develop before medical school will inform you for the rest of your life. And those numbers that got you into medical school? They never matter again.

This chapter summarizes data about the entire applicant pool, as well as about accepted applicants and people who weren’t accepted for the 2016 entering class. The data, from the AAMC Applicant Matriculant File, are accurate as of October 15, 2016. In the figures:

- “All applicants” refers to all applicants to the 2016 entering class
- “Accepted applicants” refers to those accepted to at least one medical school
- “Not-accepted applicants” refers to those not accepted to any medical school

We include data related to performance on the MCAT exam, undergraduate GPA and major, gender, age, medical/clinical and other experiences, and race and ethnicity.

A Quick Look at the 2016 Entering Class

- In 2015–2016, 53,042 people applied to the 2016 entering class at all MD-granting medical schools in the United States.

- With the introduction of the new exam in 2015, there was some concern that groups of examinees would be more reluctant than others to take the exam, but examinees from various backgrounds took the exam in the same proportions as in previous years.

The Official Guide to Medical School Admissions (2017 edition)

A comprehensive guide to medical school admissions:

- Identify prospective medical schools
- Navigate the application process
- Understand admissions decisions
- Organize and plan, with pre-med worksheets

The guide is published by the AAMC, an organization that represents U.S. and Canadian medical schools, administers the MCAT® exam, and manages the American Medical College Application Service® (AMCAS®). Visit aamc.org for more information.

Research medical schools

The AAMC also publishes comprehensive online profiles of each U.S. and Canadian medical school, featuring information that comes directly from the MCAT exam and the AMCAS application and through a partnership with medical school admissions offices. When it's time to search for medical schools, subscribe to the AAMC’s Medical School Admission Requirements (MSAR) site.
